# **Cheat Sheet: Exploring Dart Language**

## Variables and types

Туре	Description	Code example
Var	Inferred type variable	var name = 'Dart';
Dynamic	Variable types can change dynamically	dynamic x = 42;
Final	Constant at runtime	final cityName = 'New York';
Const	Compile-time constant	const PI = 3.14;

## **Functions and methods**

Туре	Description	Code example
Function	Defines a function that adds two numbers	<pre>int add(int a, int b) =&gt; a + b;</pre>
Arrow syntax	Uses arrow syntax for concise function declaration	<pre>void printItem(item) =&gt; print(item);</pre>
Required parameters	Must be explicitly provided in the function call	<pre>int multiply(int a, int b) =&gt; a * b;</pre>

about:blank 1/6

0/20, 11:101 111		aboutblank
Optional positional parameters	Can be omitted; enclosed in square brackets	String fullName(String firstName, [String middleName, String lastName])
Named parameters	Specified by name; can be required or optional with default values, enclosed in curly braces	<pre>void greet({required String name, String greeting = 'Hello'}) =&gt;    print('\$greeting, \$name!');</pre>
Default parameters	Allows default values if not provided in the function call	String describe(String name, {int age = 30, String city = 'Unknown'})
Closures	Anonymous functions that can capture variables from their context	<pre>List<int> numbers = [1, 2, 3];   numbers.forEach((number) =&gt; print(number * 2));</int></pre>

#### **Classes and OOP**

Туре	Description	Code example
Class	Defines a simple class with properties	<pre>class Person {     String name;     int age; }</pre>
Inheritance	Demonstrates basic inheritance in Dart	<pre>class Employee extends Person {    int salary; }</pre>

about:blank 2/6

13/23, 11.101 W		about.blank
Encapsulation	Uses class methods and visibility to enforce encapsulation	<pre>class Person {    String name; // Public property    int _age; // Private property, underscore prefix in Dart }</pre>
Public properties	Can be accessed from any location where the object is visible	<pre>class Person {     String name; // Public property }</pre>
Private properties	Prefixed with an underscore and can only be accessed within the class	<pre>class Person {    int _age; // Private property }</pre>
Getters and Setters	Control access to class properties	<pre>class Person {   int _age;   int get age =&gt; _age; // Getter   set age(int value) { // Setter     _age = value;   } }</pre>
Static methods	Belong to the class rather than any instance of the class and can be called without an object	<pre>class Utility {     static int add(int a, int b) {        return a + b;     } }</pre>
Anonymous functions	Used for single-expression functions; also known as lambdas or closures	<pre>var list = ['apples', 'bananas', 'oranges']; list.forEach((item) {    print(item); });</pre>

about:blank 3/6

## **Common data structures**

Туре	Description	Code example
List	Ordered collection of items	List <int> numbers = [1, 2, 3];</int>
Мар	Key-value pairs collection	Map <string, int=""> ages = {'Alice': 18, 'Bob': 20};</string,>
Set	Unordered collection of unique items	<pre>Set<string> names = {'Alice', 'Bob'};</string></pre>
Queues	FIFO collection for elements	<pre>Queue<int> queue = Queue(); queue.addAll([1, 2, 3]);</int></pre>
LinkedLists	Sequence of elements where each element points to the next	<pre>LinkedList<int> linkedList = LinkedList(); linkedList.add(1);</int></pre>

#### Libraries and command line utilities

Туре	Description	Code example
		import 'dart:math';
Import	Access built-in Dart libraries	

about:blank 4/6

75/25, 11:10 1 W		about.blank
CLI commands	Compile Dart code to native executable	dart compile exe test.dart
Dart SDK	Essential tool for running and managing Dart applications	dart run, dart create
Pub tool	Package manager to handle dependencies	dart pub get, dart pub add http
Dart DevTools	Suite for debugging and performance profiling	Performance profiling, memory analysis, and widget inspection
dart:core	Fundamental classes and functions	Handling strings, numbers, collections like List and Map.
dart:math	Provides mathematical constants and functions	sin, cos, sqrt, and constants like pi.
dart:async	Supports asynchronous programming	Future, Stream for handling asynchronous operations.
dart:convert	Handling JSON, UTF-8 encoding/decoding	jsonEncode, jsonDecode for JSON data manipulation.

Ο, .	3/23, 11.101 W		about.blatik	
	Custom libraries	Creating and using your own library	library my_utils; int add(int a, int b) => a + b;
